I'm looking for a way to determine the type of DHCP client within a server. For example, my network would have 3 type of DHCP clients: Domain, Organizational Unit and Standalone. I would like to know how can I determine the type of client which is running (the type of OS it's using and what type of DHCP server is it running). If it helps, I'm using the DHCP protocol of Microsoft. A: In network layer terminology, DHCP is client-server communication. The server is a DHCP relay, operating the DHCP protocol, and the DHCP client software is usually the DHCP client software running on your machine. The type of DHCP client you have (OS, Domain Controller, etc) is irrelevant to this protocol. As to your specific question about "domain", "organizational unit", etc: there are different types of DHCP-relayed communication in general, for organizational unit, etc. For example, PPPoE is frequently used for this type of thing. Furthermore, the type of DHCP client can be determined by examining the DHCP packet, since the client type is usually communicated in the "DHCP-message-type" field. For example, (as written by RFC 2131), the DHCP options (type 2, 3, and 4) would indicate that the client is a "standalone DHCP client". "Hark! Hark! Hark! The lark, the herald of the morn, sings loud and high; His bill Time's self has stolen from the bower of morn." - William Shakespeare: Love's Labour's Lost (Act III, Sc,

5) --- "Our lives are our stories. It takes time to learn to tell the ones worth living. ~~Mariette Hartley~~I got a divorce a year ago and am eternally grateful. I wish more couples would learn from my mistakes."
